NTG | VIT VELLORE · AIRTEL SYNC 2026

UdyamOne · Solution architecture

Main components and data flows of the current V3 prototype

Implemented local flow
Optional network / account path
Future integration

Customer / partner · web or mobile

Needs, reviewed tools, consent, orders and tracking
Four-language advisor; detailed V3 panels are English
Optional browser speech input; text and choice fallback

Staff workspace

Partner attribution, activation evidence and assistance
Pilot assignments, costs and outcomes
Staff access key stays in page memory

Optional online helpers

Network availability required

Microsoft TTS; device fallback
Optional Anthropic explanation on legacy quotes only
Quote facts only; output guarded
V3 plan text is deterministic.

needs / consent / orders
plan, findings and status

evidence / pilot outcomes
order and assistance views

LOCAL DEPLOYMENT · ONE FASTAPI SERVICE + SQLITE / FILES

API + access checks

app.py · validates requests; checks order tokens / staff access; routes every module below

HTTP / JSON, multipart uploads, static HTML / JS / CSS and provider webhooks

consented uploads / returned findings

profile + reviewed needs

Failure → re-plan → fresh owner acceptance

Needs planner

planner.py + engine.py

Keep / Add / Replace Later
Eligibility and dependencies
Compare 12-month new costs
Reads product catalogue CSV

plan

Quote + order

app.py

Recompute plan + fingerprint
Require owner acceptance
Create order + private token
Seed service activation tasks

seed tasks

Activation + recovery

activation.py + app.py

Service / site dependencies
Versioned, deduplicated events
Keep independent progress
Failures trigger a new quote

blockers

Assistance + pilot

assistance.py + app.py

5,000 leads → RF propensity
Blocker → skill / channel
Assumed effects + pilot data
No automatic staff dispatch

provider requests / validated callbacks

orders + accepted plans

tasks / events

pilot records / costs

Bill OCR + Smart KYC

kyc.py + planner.bill_draft

Bill fields → owner review
KYC verdict → bound order
Mock GST / Udyam CSVs
Temporary images deleted
KYC consent events logged

verdict

SQLite · shared persisted state

orders.db · or a separately configured demo database

Orders, accepted plans and hashed access tokens
Activation tasks / events and plan revision history
Registry / payment evidence, WhatsApp state and pilot records

state

Provider adapters

providers.py / integrations.py

HTTP / auth / scoped evidence
Signed callbacks + dedupe
WhatsApp: consent + plans
No chat orders or payments

calls / webhooks

Provider accounts pending

Adapters coded; live tests pending

Cashfree: registry evidence
Razorpay: TEST payment links and signed payment callbacks
Meta: signed WhatsApp messages and replies; shared planner
No live provider success claimed.

consent

Consent log

consent_log.jsonl
Order-linked consent metadata
No images or registration IDs

Controls that protect the decision

Fresh acceptance for recovery · uploads removed after OCR · order tokens stored as hashes
Checklist progress is not live activation; pilot assignment does not contact customers.

Future: Airtel provisioning

Approved API contract, product mapping and service checks needed.

Read left to right: review needs → accept a plan → track each service → route help.

Solid paths show implemented logical data flow within one service. Arrows do not imply separate microservices or live telecom activation.
